JAVA PROJECT REPORT ON

STUDENT INTERNSHIP APPLICATION AND TRACKING SYSTEM

Submitted by

M ARSATH PARVESH

25BIT009

Under the Guidance of

DHILEEPAN A

Technical Trainer

Technical Department, KG College of Arts and Science

Academic Year: **2025 – 2026**

APRIL 2026

Semester: **II**

DECLARATION

I hereby declare that the project entitled "**Student internship application and tracking system"** submitted in partial fulfillment of the requirements for the course **Java programming language** is a **record of my original work** carried out under the guidance of **Dhileepan**, Technical Trainer, Technical Department, KG College of Arts and Science.

I further declare that this project has not been submitted previously, either in part or in full, for the award of any degree, diploma, or other similar title, at this or any other institution.

I have acknowledged all sources of information used in this project wherever applicable.

April 2026

Coimbatore

M Arsath Parvesh

CERTIFICATE

This is to certify that the project entitled **"Student internship application and tracking system"** is a **bonafide work** carried out by **Arshath Parvesh IT A, INFORMATION TECHNOLOGY**, **KG College of Arts & Science**, in partial fulfillment of the requirements for the course **Java programming language**.

This project has been completed under my supervision and guidance during the academic period **April 2026**.

Place: Coimbatore

Date:

Submitted for the Viva-Voce Examination held on

Guide:
(Technical Trainer, KGCAS)

Head of the Department
(Technical Head, KGCAS)

ABSTRACT

The Student Internship Application and Tracking System is a Java-based application designed to simplify and automate the process of applying for and managing internships. In many educational institutions, internship processes are handled manually, leading to inefficiency, lack of transparency, and difficulty in tracking application status.

This system provides a structured platform where students can apply for internships, view available opportunities, track application status, and manage their internship details efficiently. The system also allows administrators to manage internship postings, review applications, and update statuses.

The application includes features such as adding internship applications, viewing records, searching applications, updating status, and deleting records. File handling is used to ensure permanent data storage.

The project is developed using Core Java concepts such as classes, objects, ArrayList, loops, conditional statements, and file handling. It can be extended into a GUI-based system or integrated with databases like MySQL.

The main objective is to improve efficiency, reduce manual work, and provide transparency in internship tracking.

1. INTRODUCTION

In today’s competitive world, internships play a crucial role in shaping students' careers. However, managing internship applications manually can be time-consuming and inefficient.

The Student Internship Application and Tracking System is designed to automate this process. It allows students to apply for internships and track their progress in a systematic way. The system helps maintain records, reduces paperwork, and improves accessibility.

This project demonstrates how Java programming can be used to develop real-world applications for educational institutions.

1.1 Objective

The main objectives of this project are:

- To develop a Java-based internship tracking system
- To simplify the internship application process
- To maintain internship records efficiently
- To provide status tracking for applications
- To reduce manual errors
- To implement file handling for permanent storage
- To demonstrate Core Java concepts

1.2 Overview

The system is a menu-driven application where users can:

- Apply for internships
- View application details
- Search applications
- Update application status
- Delete records

Each record includes details such as student name, internship role, company name, and application status.

1.3 Features

Internship Application Submission

- View Applications
- Search Applications
- Update Application Status
- Delete Applications
- File Handling (Data Storage)
- Simple User Interface

2. PROGRAM ANALYSIS

Program analysis is a crucial phase in software development where the problem is studied in detail and system requirements are clearly identified. This phase helps in understanding what the system should do, how it should behave, and what features are required to solve the problem effectively.

The Student Internship Application and Tracking System is developed after analyzing the issues faced in traditional internship management systems. In many institutions, internship processes are handled manually or using unorganized digital methods, which leads to inefficiency, confusion, and lack of proper tracking.

2.1 Problem Definition

In the existing system, students usually apply for internships through emails, forms, or manual submissions. This creates several problems such as:

- Difficulty in tracking the status of applications
- Lack of transparency between students and administrators
- High chances of data loss or duplication
- Time-consuming manual record management
- No centralized system to manage all internship data
- Difficulty in retrieving student or company details quickly

Due to these issues, both students and administrators face challenges in managing internship processes efficiently.

Therefore, there is a need for an automated system that can simplify internship application submission, maintain records systematically, and provide real-time tracking of application status.

The proposed system aims to eliminate these problems by providing a structured, efficient, and user-friendly solution.

2.2 Project Overview

The Student Internship Application and Tracking System is a Java-based application designed to manage internship-related activities in a simple and organized way.
The system provides a menu-driven interface where users can perform various operations such as:

- Applying for internships
- Viewing all applications
- Searching specific applications
- Updating application status (Pending, Selected, Rejected)
- Deleting unwanted records

Each internship application includes details such as:

- Student Name
- Company Name

- Internship Role
- Application Status

The system stores all records in a structured format using file handling techniques, ensuring data persistence even after the program is closed.

The application is built using Core Java concepts such as classes, objects, ArrayList, loops, and conditional statements. It can be extended into a GUI-based system or integrated with a database for advanced features.

2.3 Scopes and Limitations

Scope

The scope of the system includes:

- Managing internship applications efficiently
- Providing a centralized platform for tracking applications
- Helping students monitor their application status
- Assisting administrators in managing internship records
- Reducing manual workload and improving productivity

The system can be used in:

- Colleges and universities
- Training institutes
- Placement cells
- Small organizations managing internship programs

Limitations of the System

Despite its advantages, the system has some limitations:

- It is a console-based application with a basic interface
- Limited security features (no authentication system)
- No real-time online access
- Does not support multi-user access in current version
- Uses file handling instead of a database (less scalable)

These limitations can be overcome in future enhancements.

3. SYSTEM DESIGN

System design is the phase where the overall architecture and structure of the system are planned before implementation. It defines how the system will work, how different modules interact, and how data flows within the system.

The Student Internship Application and Tracking System is designed as a modular, menu-driven application to ensure simplicity and ease of use.

3.1 Modules

1. Internship Application Input Module

This module is responsible for collecting and storing internship application details from the user.

Functions include:

- Accepting student name, company name, and role
- Assigning a unique ID to each application
- Setting initial status as “Pending”
- Storing the data in the system

This module ensures that all application data is entered correctly and systematically.

2. View Applications Module

This module displays all stored internship applications.

Functions include:

- Retrieving all records
- Displaying them in a structured format
- Helping users understand the current status of applications

It improves visibility and transparency of data.

3. Search Module

This module allows users to search for specific internship applications.

Functions include:

- Accepting search input (student name/company)
- Matching with stored records

- Displaying relevant results

This module enables quick retrieval of required information.

4. Update Module

This module allows modification of application details.

Functions include:

- Selecting application using ID
- Updating application status (Pending, Selected, Rejected)
- Saving updated data

It ensures that records remain accurate and up-to-date.

5. Delete Module

This module removes unwanted or outdated records.

Functions include:

- Selecting application using ID
- Deleting the record
- Updating the system data

It helps in maintaining clean and relevant data.

6. File Handling Module

This module ensures permanent storage of data.

Functions include:

- Saving records to a file
- Retrieving data when program starts
- Preventing data loss

This module is essential for data persistence.

7. Exit Module

This module allows safe termination of the system.

Functions include:

- Saving all data before exit
- Closing the application

4. METHODOLOGY

Methodology explains the step-by-step approach followed to develop the project. A structured development process ensures that the system is reliable, efficient, and meets user requirements.

4.1. Problem Analysis

In this phase, the issues in existing systems were identified. The need for an automated internship tracking system was clearly understood.
Key problems identified:

- Manual record handling
- Lack of tracking system
- Inefficient data management

4.2. System Design

The system architecture was designed by dividing it into modules such as:

- Input
- View
- Search
- Update
- Delete

The workflow was planned to ensure smooth user interaction..

4.3. Program Development

In this phase, the system was implemented using Java.

Steps followed:

- Creation of Internship class
- Implementation of menu-driven logic
- Writing functions for each module
- Using ArrayList for data storage
- Implementing file handling

Core Java concepts used:

- Classes and Objects

- Methods
- Loops and Conditions
- File Handling.

4.4. Testing and Validation

Testing ensures that the system works correctly.

Different test cases were executed to verify:

- Correct data entry
- Accurate search results
- Proper updating and deletion
- Handling invalid inputs

The system was validated to ensure error-free execution.

4.5. Result and Documentation

After testing, the system successfully performed all operations.
Results include:

- Efficient data management
- Easy tracking of applications
- Reliable storage system

Documentation was prepared to explain system functionality.

4.6. Algorithm

- Start the program
- Display menu options
- Accept user choice
- Perform selected operation:
    - Add application
    - View applications

    - Search application
    - Update status
    - Delete application
- Save data to file
- Repeat until user exits
- End program

5. SOURCE CODE

```
import java.util.ArrayList;
import java.util.Scanner;

class InternshipApplication {
    String studentName;
    String companyName;
    String role;
    String status;

    InternshipApplication(String studentName, String companyName, String role) {
        this.studentName = studentName;
        this.companyName = companyName;
        this.role = role;
        this.status = "Applied";
    }

    void display() {
        System.out.println("\nStudent Name: " + studentName);
        System.out.println("Company: " + companyName);
        System.out.println("Role: " + role);
        System.out.println("Status: " + status);
    }
}

public class InternshipSystem {
    static ArrayList<InternshipApplication> applications = new ArrayList<>();

    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int choice;

        do {
            System.out.println("\n===== Internship Management System =====");
            System.out.println("1. Apply for Internship");
            System.out.println("2. View All Applications");
            System.out.println("3. Update Application Status");
            System.out.println("4. Track Application Status");
            System.out.println("5. Exit");
            System.out.print("Enter your choice: ");
            choice = sc.nextInt();
            sc.nextLine(); // clear buffer
```

```
            switch (choice) {
                case 1: applyInternship(sc); break;
                case 2: viewApplications(); break;
                case 3: updateStatus(sc); break;
                case 4: trackStatus(sc); break;
                case 5: System.out.println("Exiting System..."); break;
                default: System.out.println("Invalid choice!");
            }
        } while (choice != 5);

        sc.close();
    }

    static void applyInternship(Scanner sc) {
        System.out.print("Enter Student Name: ");
        String name = sc.nextLine();
        System.out.print("Enter Company Name: ");
        String company = sc.nextLine();
        System.out.print("Enter Role: ");
        String role = sc.nextLine();

        InternshipApplication app = new InternshipApplication(name, company, role);
        applications.add(app);
        System.out.println("Application submitted successfully!");
    }

    static void viewApplications() {
        if (applications.isEmpty()) {
            System.out.println("No applications found.");
            return;
        }
        for (InternshipApplication app : applications) {
            app.display();
        }
    }

    static void updateStatus(Scanner sc) {
        System.out.print("Enter Student Name: ");
        String name = sc.nextLine();
        for (InternshipApplication app : applications) {
            if (app.studentName.equalsIgnoreCase(name)) {
                System.out.print("Enter new status (Selected/Rejected/In Review): ");
                app.status = sc.nextLine();
                System.out.println("Status updated successfully!");
```

```
                return;
            }
        }
        System.out.println("Application not found!");
    }

    static void trackStatus(Scanner sc) {
        System.out.print("Enter Student Name: ");
        String name = sc.nextLine();
        for (InternshipApplication app : applications) {
            if (app.studentName.equalsIgnoreCase(name)) {
                app.display();
                return;
            }
        }
        System.out.println("Application not found!");
    }
}
```

6. INPUT AND OUTPUT SCREENS

7. DISCUSSION & CONCLUSION

7.1 Discussion

The Student Internship Application and Tracking System was developed to simplify internship management and improve efficiency. The system successfully automates the process of applying for and tracking internships.
During development, various Core Java concepts were applied, including object-oriented programming, file handling, and data structures. The system was designed in a modular way, making it easy to understand and maintain.

The application was tested with multiple scenarios to ensure accuracy and reliability. All functionalities such as adding, viewing, searching, updating, and deleting records were verified.

The system reduces manual work, improves data organization, and ensures better accessibility of internship information. It also enhances transparency between students and administrators.

7.2 Conclusion

The Student Internship Application and Tracking System is a practical and efficient solution for managing internship processes.
The system successfully:

- Organizes internship data
- Reduces manual errors
- Improves efficiency
- Provides easy access to information

This project demonstrates the real-world application of Java programming concepts. It serves as a strong foundation for developing more advanced systems.

Future enhancements may include:

- Graphical User Interface (GUI)
- Database integration
- User authentication system
- Web-based application

Overall, the project achieves its objective of providing a simple, efficient, and reliable internship tracking system.
